Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

nucleobases in length, that is targeted to a nucleic acid molecule
encoding STAT3 (Signal Transducer and Activator of Transcription) and
which inhibits the expression of it. (1) has antinflammatory,
antirheumatic, cytostatic and immunostimulatory activities. (1) is used
for inhibiting the expression of STAT3 in cells or tissues, treating an
animal having a disease or condition associated with STAT3 or a human
chaving a disease or condition characterised by a reduction in apoptosis,
and inducing apoptosis in a cell. Diseases or conditions that are treated
and/or neck, leukaemia, myeloma, melanome or lymphoma. (1) can also be
used for diagnostic methods in detecting and determining the role of
STAT3 in various cell functions, physiological processes and conditions
and for diagnosing the conditions associated with expression of STAT3.
(1) can be used alone or with other drugs as an immunostimulator. (1) is
used in sandwich and colourimetric assays, involving enzyme conjugation
and radiolabeling and is used in diagnostic kits. AAC93150 encodes human

The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense sequences are useful for inhibiting the expression of STAT3 in cells or tissues, inducing Fasnediated apoptosis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition foreast, prostate with STAT3. These disorders include inflammatory or autoimmune disease, particularly rheumatoid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myelomas, melanomas and lymphomas. Also treatable are human diseases or conditions characterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical apoptotic signals.
                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         STAT3; human; signal transducer and activator of transcription; ss; STAT; antisense gene therapy; Fas-mediated apoptosis; inflammatory disease; autoimmune disease; theumatoid arthritis; cancer; breast; prostate; head; neck; briain; leukaemia; myeloma; melanoma; lymphoma; apoptosis; antiinflammatory; immunosuppressive; antirheumatic; antiarthritic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                research, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAT3. The sequences represent cDNA encoding human STAT3 and human STAT3 oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound useful for treating and diagnosing inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription proteins.
                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human STAT3 antisense phosphorothioate oligodeoxynucleotide #18.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prosteglandin E2 synthese (mPCSS-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds,

having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tisques; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisquencic, immunomodulator, cardant, neuroprotective, antidiabetic, immunomodulator, cardant, neuroprotective, ophthalmatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBPB; inflammation; psoriasis; prowth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; kertosis; neoplasia; seleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```

δ g The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-INE Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used odesign the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis,

The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [1087]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense and particular present invention (see AAF45151 and AF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, bengin growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense therapy; antiproliferative; antinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding proctein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasta; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasis; kidney disease; neovascular condition; hyperplasis; kidney disease;
ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                         Gaps

The method comprises determining a level of expression of a PNC-associated gene in a patient derived biological sample, where an increase or decrease of the level compared to a normal control level of the gene indicates that the subject suffers from or is at risk of developing PNC. Also described: (1) a PNC reference expression profile, comprising a pattern of gene expression of two or more genes, i.e. PNC 1-605 or PNC 850-866 and PNC 894-906; (2) a method of screening for a compound for treating or preventing PNC or malignant PNC; (3) a kit comprising a detection reagent which binds to two or more nucleic acid sequences, i.e. PNC 1-605 or PNC 850-866 and PNC 894-906 or the encoded polypeptides; (4) an array comprising two or more nucleic acids which bind to one or more nucleic acids equences; i.e. PNC 1-605 or PNC 850-866 and PNC 894-906; (5) a composition, for treating or preventing PNC; comprising a pharmaceutical amount of: (a) an antisense polynucleotide or small interfering NNA against a method of treating or preventing PNC 606-640 and PNC 682-741 or PNC 850-87 any one gene, i.e. PNC 1-259, PNC 606-640 and PNC 682-741 or PNC 850-87 any one gene, i.e. PNC 1-259, PNC 606-640 and PNC 682-741 or PNC 850-

ingredient and a pharmaceutical carrier; and (7) a method of predicting recurrence of PNC. The compounds have cytostatic activity, and can be used in vaccines and in gene therapy. The method is useful in diagnosing PNC or a predisposition to developing PNC in a subject. The methods, compounds and compositions are useful in treating or preventing PNC. The polypeptides are useful as vaccines against PNC. The present sequence represents a reverse transcription (RT) PCR primer used in semi-quantities RT-PCR experiments related to the diagnosis of PNC, which is

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and of inhibiting the expression of antisense oligonucleotides and antisense compounds have cytostatic, antisanse oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antinflammatory, neuroprotective, neuroprotective, copthalmological, immunomodulatory and cardiavascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to offer mpGES-1, which specifically they are more in a tribibite a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibites its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, cantidiabetic, immunomodulator, cardiant, neuroprotective, notropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound con the used as mpGES-1 inhibitors and in gene therapy. The antisense compound confict on associated with mpGES-1 e.g., inflammation, Alzheimer's condition associated with mpGES-1 e.g., inflammation, Alzheimer's ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;

Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis instrected; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking
                                                                                                                                                                                                                                                                                                                                                                  with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                            This sequence represents an isolated nucleic acid sequence associated
                                                                                                                                                                      New nucleic acid sequences associated with tumor suppression, regres apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           / Match 62.0%; Score 12.4; DB 10; Length 17; Local Similarity 92.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombnant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis also be used to screen for their specific interactive molecules.

Conduct of the septemble of the sequence of the nucleotides and polypeptides can be used to screen for their specific interactive molecules.

cc sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for eightity of a SNP and for genotyping nucleic acid samples, for eightity of a SNP and for genotyping nucleic acid samples, for eightity of a snP passociation analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases eig.

Cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis, including, rheumatoid arthritis, multiple sclerosis, incroorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inspecting genetic susceptibility of Helicobacter pylori- related gastric carcinoma by checking Lewis blood-type antigen-associated gene polymorphism, applicable in screening individuals with high risk.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for inspecting the genetic susceptibility of Helicobacter pylori related gastric carcinoma. The method of the invention comprises checking the polymorphism of the Lewis blood-type antigen-associated gene, with susceptibility particularly based on the recessive se allele and/or dominant homozygous Se/Se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;

The sequences given in AAQ71110-55 are primers which were used to amplify the 17 exons of the NPZ gene. NPZ is a neurofibromatosis which is characterised by bi-lateral schwannomas. The NPZ "gene" has been shown by linkage studies to be assigned to chromosome 22. The missing or mutated gene in NPZ patients has been shown to be the merlin gene. The gene encodes a protein, merlin (moesin-ezin-radixin-like protein), which possesses tumour suppressor activity, and whose tumour suppressor activity, and whose tumour suppressor activity and whose tumour suppressor activity and makers bill and bill be on chromosome 22 between the known markers bills!

Decided to a mutant suppressor activity and whose tumour suppressor mutated in which a gene in which a gene in which a
                                                                                                                                                                                                                                               ö
genotype. The method is applicable in screening individuals with high risk and in a follow-up survey for intervention, prevention and early diagnosis. In an experiment from the invention the Lewis gene fragments with TS9G, GS08A and T10G7A polymorphism sites for PCR amplification were obtained for use after extracting samples of peripheral lymphocyte DNA from subjects. The mutation was then identified for assessing disease risk and diagnosis. The current sequene represents a PCR primer for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR primer 5 (AAT90721) and primer 6 (AAT90722) were designed to amplify DNA encoding the S4 region of human KVLQT1 (see AAW10038). PCR primers (AAT90717-28) were used in single-strand conformation analysis (SSCP) to define mutations in the human KVLQT1 gene (see AAT90730) associated with long QT syndrome (LQT). An initial SSCP identified an anomalous conformer in LQT-affected members of 6 large families. Further SSCP analyses identified a KVLQT1 intragenic deletion and 9 missense mutations associated with LQT in small families and sporadic cases
mutation of A to T at the first position of the codon encoding amino acid 220 causes the substitution of Tyr for Asn. The merlin gene may be used in gene therapy for the treatment of a merlin-associated tumour or NF2, or for prevention of schwannoma, maningioma, posterior capsular lens opacities, deafness or hearing loss, balance disorders or paralysis.

PCR primer 5 (AAT91069) and primer 6 (AAT91070) were designed to amplify DNA encoding the S4 region of human KVLQT1 (see AAA33355). PCR primers (AAT91065-76) were used in single-strand conformation analysis (SSCP) to define mutations in the human KVLQT1 gene (see AAT94004) associated with long QT syndrome (LQT). An initial SSCP identified an anomalous conformer in LQT-affected members of 6 large familities. Further SSCP analyses identified a KVLQT1 intragenic deletion and 9 missense mutations associated with LQT in small families and sporadic cases
                                                                                 syndrome; arrhythmia; minK; potassium channel; diagnosis;

The invention relates to KVLQT1 nucleic acids which have a mutation compared to wild-type KVLQT1 (AAZ98901) The KVLQT1 gene encodes a protein of 676 amino acids which forms a cardiac I(ks) poteasium channel with the KCNE1 protein (AAY80563). The KVLQT1 gene contains 15 introns and encodes a protein containing 6 putative transmembrane segments and a pore forming region. The gene has been mapped to the chromosomal location 11p15.5. The sequences AAZ9891-129892 represent PGR primers used to diagnose mutations in the KVLQT1 gene. Mutations in the KVLQT1 or KCNLE1 genes result in cardiac arrhythmias observed as a prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used for the diagnosis of subjects with long QT syndrome. They can also be used to screen for drugs which can be used for treating or preventing long QT syndrome. The KVLQT1 nucleic acids can be used for gene therapy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER
/mod_base= OTHER= phosphorothioate nucleotide. All cytosines
a/note= "OTHER= phosphorothioate nucleotide. All cytosines
a/note= Smethylcyldines. Residues 1 to 5 and 15 to 20 are
2'-methoxyethyl nucleotides."
                                            New isolated mutant KVLQT1 nucleic acids, useful for developing products for the diagnosis, prevention and treatment of long QT syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; kinesin-like 1; N2 kinesin; bimC kinesin; cellular proliferation; cancer; B-cell leukaemia; autoimmune disease; carpal tunnel syndxome; Raynaud's phenomenon; systemic sclerosis; Sjorgren's syndrome; rheumatoid arthritis; polymyositis; polyarteritis; systemic lupus erythematosus; human; ss; ISIS 344901; rat.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                            The invention relates to KVLQT1 and KCNE1 genes, associated with long QT (LQT) syndrome. It provides a minK protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp, Leu, Hisp and Ala or Thr at residues 74,76,28,32,98 and 127 respectively. Screening KVLQT1 and KCNE1 is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. Sequences AAZ30741-Z90752 represent PCR primers for defining human KVLQT1 mutations
                                                                                                                                                                                                                                                             Mutant forms of genes encoding minK protein and KVLQT1 protein involved in cardiac potassium channel formation useful for screening drugs, for preventing and treating cardiac arrhythmia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 KVLQT1; mutation; human; cardiac I(ks) potassium channel; KCNE1; ss; cardiac arrhythmia; electrocardiogram; Long QT syndrome; gene therapy; chromosome 11p15.5; PCR primer.

The present invention relates to antisense compounds, compositions and methods for modulating the expression of kinesin-like 1. The superfamily of kinesins function as molecular engines to bind and transport vesicles and organelles along microtubules using energy supplied by ATP. Kinesin-like 1, a member of the NZ (also called bimC) family of kinesins, is involved in separating the chromosomes by directing their movement along microtubules in the bipolar spindle. Kinesin-like 1 is also known as KNSII, Egy. HRSE, KIFII, thyroid interacting protein 5 and TRIPS. Inhibition of kinesin-like 1 may be a target for arresting cellular cof kinesin-like 1 expression may contribute to other disease states such as B-cell leukaemia, autoimmune diseases such as carpal tunnel syndrome, as B-cell leukaemia, autoimmune diseases such as carpal tunnel syndrome, as B-cell leukaemia, autoimmune diseases such as carpal tunnel syndrome, cof kinesin-like 1 systemic sclerosis, Sjorgren's syndrome, rheumatoid arbutisense nucleic acid oligomers, targeted to the gene concoding kinesin-like 1. Also provided are methods of screening for modulators of kinesin-like 1. Aleast a portion of the compound hybridises with RNA coff companies which is a setholycytosine. The antisense compound may comparise an antisense modely, or nucleobase. It has at least one cytosine which is a 5-methylcytosine. The antisense compound may comparise an antisense mucleic acid molecule that is specifically whybridisable with a 5'-untranslated region (UTR), with a start region, with a 3'-UTR, with an intron-cevon junction of a nucleic acid molecule encoding kinesin-like 1. ISIS #344902.
                                                                                      New antisense compound 8 to 80 nucleobases in length targeted to a nucleic acid molecule encoding kinesin-like 1, useful for treating an animal having a disease or condition such as cancer, tumor, autoimmune

The present invention relates to antisense compounds, compositions and methods for modulating the expression of kinesin-like 1. The superfamily of kinesins function as molecular engines to bind and transport vesicles and organelles along microtubules using energy supplied by ATP. Kinesin-like 1, a member of the N2 (also called bind) family of kinesin, is involved in separating the chromosomes by directing their movement along microtubules in the bipolar spindle. Kinesin-like 1 is also known as KNSII, Egs, HRSP, KIFII, thyroid interacting protein 5 and TRIPS. Inhibition of kinesin-like 1 may be a target for arresting cellular of kinesin-like 1 expression may contribute to other disease states such as B-cell leukaemia, autoimmune diseases such as carpal tunnel syndrome, of kinesin-like 1 expression may contribute to other disease states such as B-cell leukaemia, autoimmune diseases such as carpal tunnel syndrome, of kinesin-like 1 expression may contribute to other disease states such as B-cell leukaemia, uncience slerosis, Sjorgare's syndrome, rheumatoid arthritis, polymyositis and polyarteritis. Kinesin-like 1 is an autoantigen identified in systemic lupus erythematosus. The invention contributes to antisense uncieic acid oligomers, targeted to the gene concoding kinesin-like 1. Also provided are methods of screening for modulators of kinesin-like 1. Also provided are methods of screening for confine cytosine which is a 5-methylocytosine. The antisense compound may comprise an antisense mucleic acid molecule that is specifically hybridisable with a 5'-untranslated region (UTR), with a start region, with a 3'-UTR, with an intron-confine second molecule encoding kinesin-like 1 expensed molecule encoding expense to modelice acid molecule encoding kinesin-like 1 expense synthesised via solid phase P(III) phosphoramidite confine confine confine confin
                                                                                      /note= "OTHER= phosphorothioate nucleotide. All cytosines are 5-methylcytidines. Residues 1 to 5 and 15 to 20 are 2'-methoxyethyl nucleotides."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound 8 to 80 nucleobases in length targeted to a nucleic acid molecule encoding kinesin-like 1, useful for treating an animal having a disease or condition such as cancer, tumor, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 36; SEQ ID NO 161; 110pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-proteins, as specific biomolecule and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                    Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a novel method for determining the risk of or diagnosing Alzheimer's disease using single nucleotide polymorphisms (SNPs) present in an individual's mitochondrial DNA (mtDNA). In additon, the SNPs identified can be used to identify agents suitable for use in treating Alzheimer's disease. Sequences AAC67301-C67610 are PCR primers used to demonstrate the method of the invention
antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present invention relates to a hairpin or hammerhead ribozyme,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAAB2415 to AAAB6787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 19;

This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FES, GUCY2F and MCCK/MIK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimulators. The invention may be useful for developing methods for
                                                                                                                                                                                                                                                                                                                                        Activated mutant protein tyrosine kinases (e.g. NTRK3, FES and MCCK) and associated methods for diagnosing cancer and screening for anti-cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a human-derived oligonucleotide
